Rate is the flow rate or speed of the current in knots aka "drift" in the USA. Direction is the direction the current is flowing towards expressed in True degrees aka "set" in the USA. Here is a simple problem to calculate Rate and Direction based on how a vessel went off course over a period of time. Wed, 02 Jan 2019 02:29:00 GMT A simple current rate and direction problem to solve ... - These rates of change only study how f changes when either x or y is changing. Since f is a function of both x and y , both x and y are likely to change at the same time. So, we also need to study how f changes with respect to both x and y . In other words, we also need to study the rate of change of f in any direction, not just the direction of x or y . So to get maximum rate of increase per unit distance, as you leave (a,b) , you should move in the same direction as the gradient $\hat{\nabla} f(a,b)$. Then the rate of increase per unit distance is $|\hat{\nabla} f(a,b)|$.
