In an ideal trigonal planar species, all three ligands are identical and all bond angles are 120° . Such species belong to the point group D_{3h} . Molecules where the three ligands are not identical, such as H ... MolView - In chemistry, the ball-and-stick model is a molecular model of a chemical substance which is to display both the three-dimensional position of the atoms and the bonds between them. The atoms are typically represented by spheres, connected by rods which represent the bonds. Double and triple bonds are usually represented by two or three curved rods, respectively, or alternately by correctly ...
